Download Anjaana Anjaani 1080p Aaj Entertainment Watch Online Free on your desktop.Q: Create a 0-3 list for a one-hot encoded data, with the highest values always being 0-3 I'm currently working on the task of labeling certain word vectors as either 0, 1, 2 or 3 (and thereby increasing their frequency in the distribution) and labeling all other word vectors as 0. This is necessary for feed the resulting labeled vectors into a neural network. The problem I'm currently having is that I cannot change the values of the vectors, so I cannot easily create a 0-3 list without the highest values being all 0 or all 3. The closest I've come to is the following: >>> unlabeled_vector_1 = [0.4465966, 0.4042195, 0.3113771,...] >>> unlabeled_vector_2 = [0.5496542, 0.4887086, 0.4386514,...] for i in range(0, len(unlabeled_vector_1)): if unlabeled_vector_1[i] > unlabeled_vector_2[i]: unlabeled_vector_2[i] = 3 unlabeled_vector_1[i] = 0 The problem here is that the if-condition is not satisfied for every word vector, and thus there are some points which are labeled as 3 while they should be labeled as 0. Question: What is a more efficient way to approach this? I don't want to have to

run through the whole list, since it's quite big. A: Instead of having them all start at 0 and being incremented, perhaps you could just add an attribute to the word vectors, which reflects their correct class (and it's an attribute you can modify later), and then determine which vector has the highest class. AFAIK the tensorflow documentation does not have a way of accessing the class of an element, but I think it's possible to store a vector as a class and then index it according to that classification. Edit: Here's
